My Individual Contribution

For Module 2, my individual contribution focused on completing and verifying the machine learning development tools lab in Google Colab. I worked through all 16 notebook cells and made sure the code was executed successfully before moving forward. I used the Iris dataset while working with pandas, NumPy, and Matplotlib, and I checked the outputs produced by the notebook.

A major part of my work was reviewing data and visualizations. I practiced using pandas DataFrames to organize the dataset, used NumPy for numerical calculations, and examined the graphs created with Matplotlib. NumPy and interpreting the graphs were the most challenging parts for me, so I spent extra time connecting the code to the results shown in the outputs.

After completing the notebook, I ran the work again to make sure the outputs and visualizations were visible and reproducible. I then exported the completed notebook as a PDF and checked that the code, outputs, and graphs could be read clearly. I also completed my personal Reflection Journal, focusing on what I learned and the areas that were difficult for me.

My contribution to the group project is my own completed Module 2 lab work and documentation. I am responsible for providing my completed notebook, notebook PDF, Reflection Journal, and this Individual Team Member Contribution Journal for the team Git repository. This journal documents only the work I personally completed for this assignment.

Summary of My Work

Completed all 16 cells in the Module 2 Google Colab notebook.

Worked with the Iris dataset using pandas, NumPy, and Matplotlib.

Ran and verified notebook outputs and visualizations.

Exported the completed notebook as a readable PDF.

Completed the Module 2 Reflection Journal.

Prepared my individual project files for the team Git repository.
